# INTRODUCTION

- ADCT-402 (loncastuximab tesirine [Lonca-T]) is an antibody drug conjugate composed of a humanized CD19-specific IgG1 antibody (Ab) stochastically conjugated to tesirine, a pyrrolobenzodiazepine (PBD) dimer cytotoxin via a cleavable maleimide linker.
- A two-part Phase 1 dose-escalation trial of heavily pretreated patients with B-cell non-Hodgkin lymphoma is ongoing to assess the safety and tolerability of Lonca-T 15 to 200 µg/kg administered every 3 weeks (q3w) by intravenous infusion (NCT02669017):
- Part 1: to define a maximum tolerated dose and dose for part 2
- Part 2: to assess safety and tolerability at the part 1-recommended dose.
- Interim safety and efficacy data of Lonca-T are presented in a separate oral presentation (Abstract 187)
- Here, we present pharmacokinetic (PK) data elucidating the relationship between drug exposure and response in terms of safety and efficacy.

# STUDY OBJECTIVES

• To model the dose and PK exposure of Lonca-T as drivers of safety (treatment-emergent adverse events [TEAEs]) and efficacy (reduction in tumor size) for the recommended Phase 2 dose.

# **STUDY DESIGN**

- Concentrations of PBD-conjugated Ab in serum were determined using a validated electrochemiluminescence immunoassay.
- Data were analyzed by population PK methodology using NONMEM (version 7.3, first-order conditional estimation).
- The base PK analysis employed the log-transformed both sides approach with a 2-compartment open model and zero-order infusion rate (Figure 1).
- Area under the curve (AUC) values were estimated from individual patient Bayesian post hoc predictions.
- The influence of various covariate factors on PK variability was assessed and included age, gender, race, body surface area (BSA), body mass index, weight, albumin, alanine aminotransferase, aspartate aminotransferase, bilirubin, creatinine clearance, and hemoglobin (Hb).
- PK exposure trends with maximum severity of early (Cycle 1) and later (all cycles) TEAEs for any grade TEAEs, anemia, platelets, neutrophils, Hb, fatigue, edema, and pleural effusion were graphically explored.
- Apparent trends were quantitatively assessed with logistic regression relating the probability of the following binary outcome variables with AUC and demographic factors (age, sex, weight, BSA, and maximum Eastern Cooperative Oncology Group status):
- Grade ≥3 maximum severity TEAE
- Grade ≥3 platelet decrease
- Grade ≥1 edema or pleural effusion.
- · Associations of dose and PK with maximum change from baseline tumor size were determined to identify potential relationships between exposure and activity (at least 50% reduction; complete response and partial response).

# RESULTS

### **Patient characteristics**

• Data for 77 patients (53 men, 24 women), comprising 1138 observations, were included in the population PK model (Table 1).

| Patient characteristic                          | Mean (SD)    | Median (min, max  |  |  |
|---|--------------|-------------------|--|--|
| Dose, µg/kg                                     | 144 (60.0)   | 150 (14.7, 205.0) |  |  |
| Age, years                                      | 64.3 (12.8)  | 66 (24, 85)       |  |  |
| Weight, kg                                      | 86.3 (23.2)  | 83.9 (42.1, 160.0 |  |  |
| Body mass index, <sup>a</sup> kg/m <sup>2</sup> | 28.9 (7.33)  | 28.1 (17.6, 46.4) |  |  |
| Body surface area, <sup>a</sup> m <sup>2</sup>  | 1.95 (0.364) | 2.02 (1.36, 2.75) |  |  |
| Albumin, g/dL                                   | 4.03 (0.445) | 4.0 (2.9, 5.0)    |  |  |
| Alanine aminotransferase, IU/L                  | 21.4 (12.2)  | 19.0 (5.0, 72.0)  |  |  |
| Aspartate aminotransferase, IU/L                | 26.1 (14.5)  | 22.0 (11.0, 82.0) |  |  |
| Bilirubin, µM/L                                 | 8.1 (5.25)   | 6.8 (2.9, 32.5)   |  |  |
| Creatinine clearance, <sup>a</sup> mL/min       | 96.5 (43.6)  | 84.0 (27.6, 269.0 |  |  |
| Hemoglobin, g/L                                 | 116 (13.5)   | 115 (80, 148)     |  |  |

#### **Final population PK model**

- Final population PK model parameters are provided in Table 2.
- There was a strong correlation between observed and estimated
- serum drug concentrations (Figure 2, Figure 3).
- Exposure and associated magnitude of intersubject variability increased with dose (data not shown):
- Apparent terminal half-life values were long but moderately variable
- Modest drug accumulation was seen with repeated dosing.
- BSA significantly affected volume of distribution (Table 2).
- No other significant covariates were identified.

#### Relationship between exposure and safety

- Increased exposure (AUC) of PBD-conjugated Ab was associated with probability of Grade ≥3 platelet decrease in Cycle 1 (p=0.0067) and any TEAE Grade ≥3 during Cycle 1 and all cycles (both; p=0.031) (Figure 4, Table 3):
- For any TEAEs Grade  $\geq$ 3, men appeared to be more sensitive than women (Figure 4F)
- A visual trend of increased AUC with probability of Grade ≥1 edema or pleural effusion was apparent (Figure 4E).
- increased probability of objective response (p=0.0439) (Figure 5).
- significantly associated with increased probability of objective response (p=0.0292).

Open symbols represent observed data. Black lines denote median (solid) and 5th and 95th percentiles (dashed) of simulated concentrations. Green lines denote median (solid) and 5th and 95th percentiles (dashed) of observed concentrations. Shaded regions denote 95% confidence

## CONCLUSIONS

- The PK profile of PBD-conjugated Ab after administration of Lonca-T was described using a linear 2-compartment model.
- BSA was a significant covariate of volume of distribution. - It is unclear if body size-based dosing is appropriate but will be investigated further when more data are available.
- Significant positive correlations were observed between PBD-conjugated Ab exposure (AUC) and incidence of Grade  $\geq 3$  TEAEs (Cycle 1 and all cycles), and Grade  $\geq 3$ platelet decrease in Cycle 1:
- Frequency of Grade ≥3 TEAEs were higher with protracted doses; limiting the number of cycles administered will control the rate of severe adverse events
- For severe adverse events, men may be more sensitive than women
- A relevant trend was apparent between AUC and Grade ≥1 edema or pleural effusion.
- Interim efficacy assessment indicated significant dose-response and exposure-response relationships for Lonca-T when administered with a g3w schedule.
- Since this trial is ongoing, other pending data will be incorporated when available
